

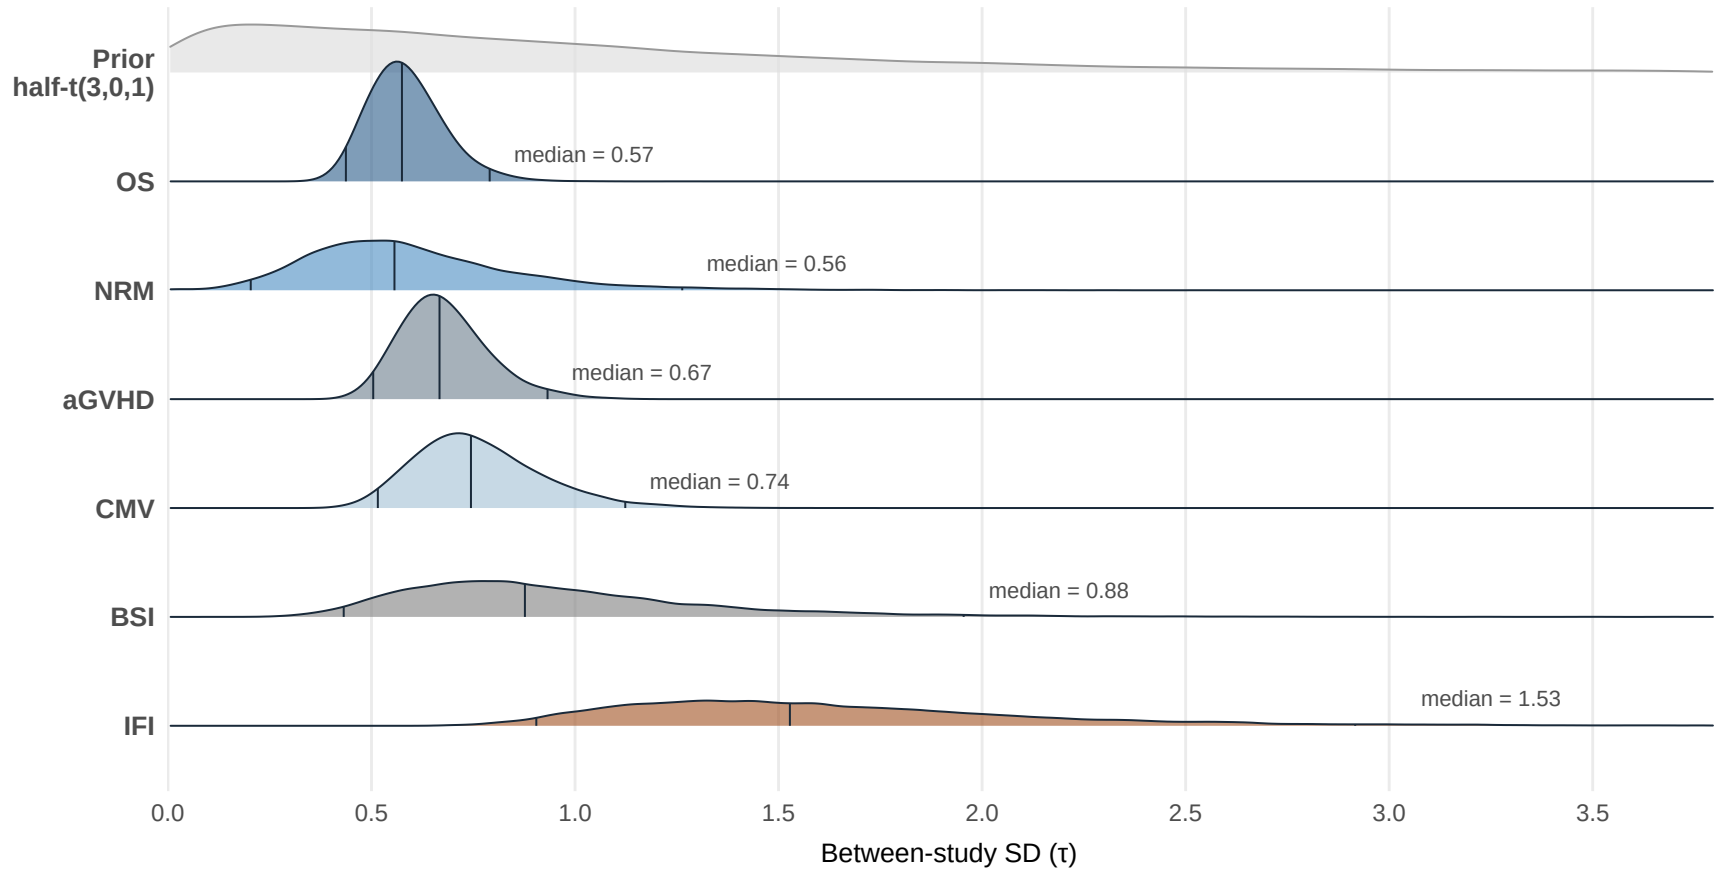

Figure S7c: Heterogeneity (τ) Posteriors — Comparison 1 M1 Models

Posterior densities of the between-study SD (τ) for six outcomes.

Grey density (bottom): reference prior — half-Student-t(3, 0, 1). Vertical lines: 2.5th, 50th, 97.5th posterior percentiles.

All posteriors are substantially shifted from the prior, indicating the data are informative about τ .

IFI shows the widest posterior (median $\tau = 1.53$), consistent with structural outlier heterogeneity identified in the leave-one-out analysis (Appendix S9). BSI: median $\tau = 0.88$; OS: median $\tau = 0.57$.
